簡介

I am a Software Engineer specializing in AI agent systems and enterprise workflow automation.

Currently working as an AI Application Engineer, I design and build agent-driven CRM workflows that automate enterprise operations through API-based execution. My work focuses on multi-agent orchestration, backend integration, and transforming business logic into modular, agent-invokable services.

Previously, I worked on enterprise CRM development using C#, .NET, and SQL Server, handling system design, feature implementation, and quality control. I also gained experience in QA within the med-tech industry, building a strong foundation in system reliability, testing, and validation.

I am particularly interested in building reliable, scalable, and controllable AI systems for real-world enterprise applications.

經歷

鼎新數智股份有限公司

8 個月

Junior AI Application Engineer

2026 年 2 月 - Present (3 個月)

新店

- Contributed as a core developer to a new AI agent product, building a platform to automate enterprise CRM maintenance workflows.
- Developed AI agents on a commercial AI agent platform to automate CRM operations through API-based execution.

- Designed prompt templates and agent execution logic to enable LLMs to perform structured CRM workflows.
- Built AI workflow pipelines enabling orchestration and collaboration between multiple agents and backend services.
- Integrated enterprise CRM APIs to support automated operations such as repair order management, status queries, and data validation.
- Implemented multi-step agent workflows to guide task execution, including validation, confirmation, and API invocation.
- Refactored legacy CRM maintenance logic into modular backend services for agent-based invocation.
- Designed and implemented RESTful APIs for enterprise system integration, documented using OpenAPI (Swagger).
- Collaborated with cross-functional engineering teams across Taipei and Taichung to develop and integrate the AI agent platform.

Junior Software Engineer

2025 年 9 月 - 2026 年 1 月 (5 個月)

新店

- Took ownership of System Design , Program Implementation , and Quality Control responsibilities for enterprise CRM customization projects, translating clarified client requirements into system logic design, feature implementation, and functional verification.
- Developed customized modules, UI components, and backend logic using C#, .NET Framework, ASP.NET Web Forms, and SQL Server.
- Proactively reviewed and updated onboarding and development documentation by correcting outdated content and adding practical, up-to-date implementation details, improving alignment with current systems and development workflows.
- Mentored and onboarded a new team member through hands-on guidance on internal development tools, workflows, and system architecture, reducing ramp-up time by ~40% and enabling independent contribution.

- Conducted functional testing and debugging to ensure customized features met requirements prior to handoff for UAT with consultants and clients.

新店

- Executed functional testing for the "活力細胞" mobile app and its web-based management dashboard by designing test cases, reporting issues, and validating fixes, ensuring high-quality releases.
- Performed functional and exploratory testing for the MegoLuki mobile app, verifying core user flows, UI/UX behavior, and feature stability across different scenarios, and collaborating with the team to identify and report defects.
- Performed structured motion testing (nodding, shaking) for Cleer wireless headphones under exercise and public transportation scenarios, collecting sensor accuracy data to validate motion-triggered features and improve device stability.
- Collected and analyzed real-world sensor and firmware performance data for Oura Ring wearable devices, supporting engineering teams in validating sensor accuracy and ensuring reliable firmware updates.
- Performed API integration testing using Postman to validate response accuracy, logic, and formatting, increasing defect detection efficiency and improving backend–frontend consistency.
- Managed defect lifecycle and coordinated cross-team issue resolution in Jira within an Agile environment, streamlining sprint workflows and accelerating feature delivery.
- Developed Python automation scripts to validate machine learning model accuracy, increasing test coverage and reducing manual verification effort.
- Validated machine learning model predictions against defined criteria and collaborated with engineers to improve model quality and ensure production readiness.
