簡介

I am a Software Engineer focused on building and maintaining reliable enterprise systems, with a strong emphasis on system stability, business logic, and long-term maintainability.

I currently work in an enterprise software environment, where I am responsible for maintaining CRM systems, resolving production issues, and improving existing functionality. My work involves understanding complex business workflows, tracing issues across legacy codebases, and ensuring system behavior remains correct and predictable as requirements evolve.

Earlier in my career, I worked as a QA intern in the med-tech industry, primarily responsible for manual testing across web, mobile, firmware, and LLM-based systems. This experience trained me to carefully observe system behavior, identify edge cases, and develop a strong awareness of quality, correctness, and risk in complex, regulated systems.

With experience spanning both quality assurance and software engineering, I bring a system-level perspective to development. I value clear logic, predictable behavior, and solutions that prioritize reliability and maintainability over short-term fixes.

My long-term focus is to continue growing as a software engineer who understands enterprise systems deeply and contributes to building robust, dependable software with lasting value.

經歷

鼎新數智股份有限公司

6 個月

Junior Software Engineer | AI Agent Systems & Enterprise Automation
2026 年 2 月 - Present (1 個月)

新店

- Built a chat-based AI interface for the CRM maintenance module, enabling users to create and manage repair orders through natural language input.
- Developed modular, function-specific AI agents for maintenance workflows (e.g., repair order creation, status query, customer validation), enabling structured task execution through agent orchestration.
- Authored and optimized production-grade prompts to ensure deterministic agent behavior and strict adherence to CRM maintenance business rules.
- Refactored legacy maintenance module logic into agent-invokable backend services while preserving workflow integrity and data consistency.
- Designed and implemented RESTful APIs to expose maintenance-related backend operations for AI agent invocation, documented using OpenAPI (Swagger).

Junior Software Engineer | Enterprise CRM Customization 2025 年 9 月 - 2026 年 2 月 (6 個月)

新店

- Took ownership of System Design , Program Implementation , and Quality Control responsibilities for enterprise CRM customization projects, translating clarified client requirements into system logic design, feature implementation, and functional verification.
- Developed customized modules, UI components, and backend logic using C#, .NET Framework, ASP.NET Web Forms, and SQL Server.
- Proactively reviewed and updated onboarding and development documentation by correcting outdated content and adding practical, up-to-date implementation details, improving alignment with current systems and development workflows.
- Mentored and onboarded a new team member through hands-on guidance on internal development tools, workflows, and system architecture, reducing ramp-up time by ~40% and enabling independent contribution.
- Conducted functional testing and debugging to ensure customized features met requirements prior to handoff for UAT with consultants and clients.

QA Intern

2025 年 2 月 - 2025 年 8 月 (7 個月)

新店

- Executed functional testing for the "活力細胞" mobile app and its web-based management dashboard by designing test cases, reporting issues, and validating fixes, ensuring high-quality releases.
- Performed functional and exploratory testing for the MegoLuki mobile app, verifying core user flows, UI/UX behavior, and feature stability across different scenarios, and collaborating with the team to identify and report defects.
- Performed structured motion testing (nodding, shaking) for Cleer wireless headphones under exercise and public transportation scenarios, collecting sensor accuracy data to validate motion-triggered features and improve device stability.
- Collected and analyzed real-world sensor and firmware performance data for Oura Ring wearable devices, supporting engineering teams in validating sensor accuracy and ensuring reliable firmware updates.
- Performed API integration testing using Postman to validate response accuracy, logic, and formatting, increasing defect detection efficiency and improving backend–frontend consistency.
- Managed defect lifecycle and coordinated cross-team issue resolution in Jira within an Agile environment, streamlining sprint workflows and accelerating feature delivery.
- Developed Python automation scripts to validate machine learning model accuracy, increasing test coverage and reducing manual verification effort.
- Validated machine learning model predictions against defined criteria and collaborated with engineers to improve model quality and ensure production readiness.
